

Your chair is either ergoCentric or it's not.

Adjustment paddles

Unique to ergoCentric, easily-identified instruction icons represent adjustment paddle shapes and are clearly visible on an icon plate located on the side of the seat. The convenient location of these icon plates provide a clearer view of the chair's adjustment options.

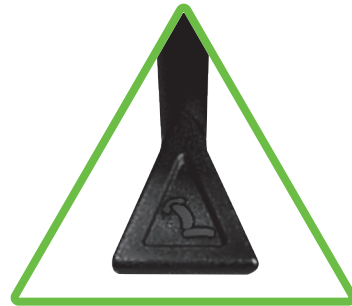

Geometric shaped adjustment paddles differentiate the chairs' adjustment controls helping users to instantly recognize an adjustment option by simply feeling the paddle's shape.

Back Height System

Easy to reach from the seated position, the patented back height adjustment mechanism is spring loaded to provide effortless support adjustment.

Five inches of infinite adjustment provides the widest range of adjustability available on any chair.

Back Angle

Back angle adjustment allows the backrest angle to be more than 90° in relation to the seat to help return the natural curve to the lumbar spine.

Seat Height

A wide range in optimal pneumatic cylinders easily accommodates a variety of lower leg lengths and work height requirements while allowing the chair to swivel for easy reach of work items.

Seated Angle

Seat angle tilts the seat pan forward and backward providing a maximum range in postures to change pressure points on the seat and relieve pressure on the veins.
